Luis Enrrique Salas Luna

| @: cslesel24@gmail.com | #:(51) 939 333 354

Computer Science graduate from Universidad Católica San Pablo, focused on building full-stack web products (Next.js, React, TypeScript, Supabase) and AWS infrastructure.
Experience building SaaS products end to end: monorepo architecture, database modeling with RLS, payments with Stripe and Openpay, WhatsApp messaging (Twilio), real-time features, database-level security and infrastructure as code with Terraform.
Issue-driven workflow with acceptance criteria, Git version control with conventional commits, and AI coding assistants integrated into the development process.

- GitHub: Lesel22

Work Experience

Full-Stack Developer — Remote Contractor (Mexican startup)
Period: May 2026 - Present
Work arrangement: Remote, independent contractor

Kurssy — LMS platform for Latin America (pre-launch)

- Built an LMS platform in a monorepo (Turborepo + pnpm) with Next.js 16, React 19, TypeScript, Supabase and Stripe, deployed on Vercel.
- Architected 3 independent role-based apps (student, instructor, admin) on separate subdomains, with shared authentication via cookie domain and roles injected into the JWT through a custom access token hook.
- Designed a PostgreSQL database with RLS on every table, versioned migrations and auto-generated TypeScript types.
- Stripe e-commerce: multi-product cart, stackable coupons with a discount cap, site-wide promotions, checkout and webhooks on Supabase Edge Functions.
- Instructor revenue-sharing system: immutable earnings ledger, payout requests with secure SQL state transitions (SECURITY DEFINER) and an approval queue in the admin panel.
- Migrated storage to AWS: private S3 buckets served through CloudFront (OAC, signed URLs and cookies), infrastructure as code with Terraform, and multipart uploads with progress tracking.
- PDF certificate generation in Edge Functions (Deno + pdf-lib), drag-and-drop curriculum editor (@dnd-kit), real-time messaging and notifications.

Plannr / GradHub — University graduation platform (in production)

Platform for organizing committees to manage graduation events: packages, payments, attendee messaging, and table and seat selection. Built for a Mexican client, with an admin panel and an attendee-facing app.

- Monorepo (pnpm + Turborepo) with 4 Next.js 16 / React 19 / TypeScript apps (admin and attendee), deployed on Vercel on top of Supabase: PostgreSQL, Auth, Storage, Realtime and Edge Functions (Deno).
- Real-time table and seat selection: PostgreSQL RPCs with capacity validation and concurrency control, turn-based queue, live monitor, manual assignment by organizers and automatic Realtime channel reconnection; tested with simulated multi-attendee sessions.
- Visual floor-plan editor with Konva: round and rectangular tables, reusable templates, image or sanitized SVG backgrounds, and browser-generated thumbnails.
- Openpay payments: installment payments for packages and add-on products, reconciliation of abandoned charges, automatic refunds of overpayments, and PDF receipts generated in an Edge Function.
- WhatsApp inbox (Twilio) for admins: approved templates, 24-hour messaging window, signature-verified webhook, PWA push notifications and per-message sender tracking.

- Security: phased lockdown of anonymous access with RLS, restricted SECURITY DEFINER functions, role checks on every server action, private Realtime channel, login rate limiting, and a custom audit script (security:check) run against production.
- Dependency modernization (Next 16.4, TypeScript 6, ESLint 10) with type checking, linting and builds at every step: library security advisories reduced from 152 to 11.
- Issue-driven work with one branch per change, OpenSpec specifications, technical documentation and decision summaries for leadership.

Universidad Católica San Pablo
Private Peruvian university
Period: March 2023 - December 2024
Role: Undergraduate Research Assistant (thesis) on project "CPI2023-42 Computational methods for the interactive analysis and prediction of criminal activity in Peruvian urban centers", supervised by Erick Mauricio Gómez Nieto, PhD (emgomez@ucsp.edu.pe).
Responsibilities
- Cleaned and structured large datasets for use in machine learning (ML) models.
- Built visualization models using tools such as scikit-learn, Folium and Tableau.
- Authored the related research project "Automatic detection and analysis of crime hotspots in urban centers using deep learning" (in Spanish).

Achievements
- Adapted a weather-forecasting model to crime detection with acceptable accuracy, laying the groundwork for future research.

Period: March 2021 - December 2021
Role: Assistant, Computer Science Department
Responsibilities
- Maintained and updated the department website, adding newly published research and creating new informational sections.
- Organized academic and administrative events, managed registrations through digital forms (Google Forms) and prepared detailed reports for the university.
- Advised students on requirements and availability of extracurricular credits.
- Recorded, documented and created new entries for institutional publications.

Achievements
- Built a page for students to check their extracurricular credit status at any time.
- Successfully organized multiple department events and handled their promotion.

Education and Certifications

- **Tecsup** - Course: "Full-Stack Web Development with Python - E-learning"
- **Universidad Católica San Pablo** - B.S. in Computer Science (Professional Degree)
- **AWS** - AWS Academy Graduate - AWS Academy Cloud Architecting 2023

Technical Skills

- **Advanced:** Python, SQL
- **Intermediate:** TypeScript, Next.js / React, Supabase / PostgreSQL, Stripe / Vercel, Git / GitHub, Turborepo / pnpm, AWS (S3, CloudFront, IAM), Figma
- **Basic:** Terraform
